

Fractured Universe

Play

Welcome! This short guide helps you start the game, understand what each part of the screen is for, and avoid common headaches. It does not reveal plot or surprise content.

The pictures in this PDF are either your own screenshots (if you added them) or simple placeholders with the same layout labels. When you play, your real UI will match those labels.

Start the game (easy steps)

1. Open PowerShell.
2. Go to the game folder, for example:
`cd "C:\Users\YourName\Downloads\FU-Commander-Update2.01"`
3. Start a tiny local server:
`python -m http.server 8000`
4. In Chrome or Edge, open:
`http://127.0.0.1:8000/fractured-universe-commander-update.html`

Why not double-click the HTML file? Some browsers block that mode for bigger games. Using the address above avoids that. Press Ctrl+C in PowerShell when you are done playing.

How you play

You mostly click. Tabs switch views. The bottom bar shows your resources. The center map has + and - to zoom and a circle button to reset the view. Type in chat or search boxes when you see them; Enter often sends a chat message.

Saving your progress

The game saves on its own about every half minute while you are playing. Data lives in your browser storage, so use the same browser and the same address (for example always 127.0.0.1:8000) if you want the same empire. Clearing site data or switching browsers starts you fresh.

The main screen

This is home base. Top row: commanders, optional coin shop, sound, chat, guild, tech tree, market, inventory, your faction name, and account menu. Left column is all planet work. Center is the star map and ship yard. Right column is ship research and rankings.

Planet list — Owned

Here are the worlds you control. Rename for clarity, Search to look for artifacts, Destroy only if you really mean it. Scout New Planet spends credits and fuel to reveal another world after a short wait. Bounties opens the bounty board.

Planet list — Available

Neutral planets waiting for someone to claim them. Claim costs resources. Grow here when you are stable on income and defense.

Planet list — Enemy

Worlds held by other factions. Attack starts a fight. Expect notifications and event-log messages so you know what happened.

Clusters

Late-game organization: merge many planets into one cluster tier by tier. Buttons stay gray until you have enough pieces for that tier.

Buildings

After you select a planet (or cluster) under Owned, open Buildings to construct or upgrade. Each building shows metal and credit costs and a max level.

Ship Production — Build

Build only ships you finished researching. Pick a quantity, press Build, and watch the queue. Costs come from your bottom-bar resources.

Ship Production — My Fleet

Fleets are groups of ships for travel and fights. Create Fleet, then add ships. Try Fleet Duel for practice. Save Template if you like a setup and want to reuse it.

Adding ships to a fleet

You can mix ship types until you hit the stack limit shown at the top of the window. MAX fills one row up to what you own. Confirm to move ships into the fleet.

Ship Production — Maintenance

Every ship adds an hourly credit cost. If this number feels high, retire old hulls or keep fewer ships in service.

Ship Research — Available

Research unlocks hulls for building. Complete marks what you already have. Research starts a timer. Locked means you need another hull first.

Rankings

A friendly scoreboard. The mix of planets and firepower decides rank—check the formula on screen when you open it.

Bounties

Browse contracts on players. Filters help you focus on huge payouts or your own listings. Search narrows the list by name.

Quick tips

- Scout and claim in bursts when your income is positive.
- Research before you mass-build—otherwise build buttons stay empty.
- Read the red warnings; they usually mean missing resources or prerequisites.
- If audio never starts, click anywhere once, then hit the speaker icon again.
- Guild, market, and chat are on the top icon row—handy when you need people or trades.

If something goes wrong

Blank page: use `http://127.0.0.1:8000/...` not `file://`. Make sure `python -m http.server` is running.

Wrong save: you might have opened a different port or browser before. Stick to one address.

Stuck UI: refresh once; if still bad, clear site data for 127.0.0.1 and start clean.

Replace placeholder art: save PNG files under `manual_assets/screenshots/` using names like `01-main-hud.png`, then run this script again.
